                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high modar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR123072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the innext adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC798624 11.65.x Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_146625.31.65.x, genomic

Sequence recovery method was inverse PCR.
Sequence orientation is forward strand relative to 5' end of P
element.

This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of an HCV RNA (portion) and a sense strand (SS) that is complementary to (part of ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with conditionation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit concerned relation of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target can cirrhosis), and also for drug screening, pharmacogenomics, condentification and yellidation, genetic engineering, pharmacogenomics, collular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different many dif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              short interfering nucleic acid; siNA; virus replication inhibition; heparitis C virus; HCV; sugar modification; virucide; antiinflammatory; hepartotropic; cytostatic; RNA interference; HCV infection; liver failure; hepartocellular cancer; cirrhosis; ss.
                                                                                                                       New double-stranded short interfering nucleic acid comprises sugarmodified pyrimidine bases useful for treating infection with hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       strains. NOTE: This sequence may contain one or more of several modifications, including 2'-deoxy-2'-filuoro U or C (u or c); thymidine (T); inverted deoxy abasic (B); phosphorothioate linkage (s); universal base 5-nitroindole (X); universal base 3-nitropyrrole (Z). These modifications are specified in table 3 of the specification (pages 150-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to novel double-stranded short interfering nucleic acids (GiNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (AS) that is complementary to (part of) an HCV RNA (portion) and sense strand (S) that is complementary to (part of) an HCV RNA (portion) and sense strand (S) that is complementary to ASS, and where most of the pyrimidine nucleotides compruse a sugar modification. The invention may allow development of compounds with virucide, antinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The sinks so ft he invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure, hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide conserved regions of HCV genes, so are active against many different cellular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different modifications, NOTE: This sequence may contain one or more of several modifications, including 2'-deoxy-2'-fluoro U or C (u or c); thymidine (T); inverted deoxy abasic (B); phosphorothioate linkage (B); universal base 5 initropyrrole (Z); these
                                                                                                                                                                                                                                                              New double-stranded short interfering nucleic acid comprises sugarmodified pyrimidine bases useful for treating infection with hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modifications are specified in table 3 of the specification (pages 150-

```
The invention describes an isolated, secreted and transmembrane polypeptide (I), termed PRO polypeptide. (I) Is useful for detecting PRO5131, PRO1311, PRO1411, PRO14019, PRO245, PRO5307, PRO5313, PRO5004, PRO5230, PRO5250, PRO541, fibroblast growth cfactor receptor (FGFR)-4, FGFR-3, FGFR-2 or FGFR-1 polypeptide, and for linking a bioactive molecule e.g. toxin, radiolabel or antibody, to a cell expressing the polypeptides. The bioactive molecule causes cell death. (II) Is useful as hybridisation probes, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of propeptide, for generating transgenic animals of therapeutically useful reagents, and for the genetic analysis of therapeutically useful reagents, in gene therapy, and for chromosome conductions which are responsive to the PRO polypeptide or anti-for treating conditions which are responsive to the PRO polypeptide or anti-creating conditions which are responsive to the PRO polypeptide or anti-creating conditions which are responsive to the PRO polypeptide or anti-creating conditions which are responsive to the PRO polypeptide or inhibiting tumour growth, enhances vascular permeability and immune creating hearing learning loss in mammals, and for treating hearing loss in mammals, and for treating bearing loss in mammals, and for treating bearing useful contracting a probe used to detect DNA encoding a novel human secreted and creating and created and created and created and archititis. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thirty seven nucleic acids encoding novel secreted and transmembrane PRO polypeptides, useful for modulating biological activity of cell expressing the polypeptide, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ashkenazi AJ, Baker KP, Botstein DA, Desnoyers L, Eaton DL; Ferrara N, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Gurney AL, Kljavin IJ, Mather JP, Napier MA, Pan J; Paoni NF, Roy MA, Stewart TA, Tumas' D, Watanabe CK, Williams PM; Wood WI, Zhang Z;

The invention describes an isolated, secreted and transmembrane polypeptide (PP), termed PRO PP or fibroblast growth factor receptor PP (1). (1) is useful for detecting PRO513, PRO301, PRO317, PRO3131, PRO1411, PRO140096, PRO246, PRO6003, fibroblast growth factor receptor PRO10096, PRO246, PRO6003, fibroblast growth factor receptor CRO PRO91096 PRO246, PRO6004, PRO4156, PRO2610, PRO265 or PRO91096 PRO91096, PRO6004, PRO4156, PRO2610, PRO265 or CRO FRO91096 or and for linking a bloactive molecule, a costill expressing the above polypeptides. The bioactive molecule, a coxin, captionary proteins or molecules involved in binding interaction. The polynucleotide (II) encoding (I) is useful in chromosome and generation of antisense RNA and DNA, for generating capping, in generation of antisense RNA and DNA, for generating cevelopment and screening of therapeutically useful reagents, to development and screening of therapeutically useful reagents, in development and screening of individuals with genetic disorders, in generator, processed and for the genetic analysis of individuals with genetic disorders, in generatory, for chromosome identification and as a chromosome marker. (1) are useful for tissue typing. This sequence represents a convel human secreted and transmembrane PRO polypeptide associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, for identifying agonists antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ashkenazi AJ, Baker KP, Botstein DA, Desnoyers L, Eaton DL;

New secreted and transmembrane polypeptide for modulating biological activity of a cell expressing the polypeptide, identifying agonists or antagonists of the polypeptide, and as molecular weight markers.

# Example 17; Page 60; 254pp; English.

The invention describes an isolated, secreted and transmembrane polypeptide (I), termed PRO polypeptide. (I) Is useful for detecting PRO533, PRO3101, PRO197, PRO411, PRO10066, PRO24507, PRO533, PRO2401, PRO24507, PRO533, PRO50101, PRO4156, PRO5265, PRO5401, fibroblast growth factor receptor (FGFR)-4, FGFR-2 or FGFR-1 polypeptide, and for linking a bioactive molecule e.g. toxin, radiolabel or antibody, to a cell expressing the polypeptides. The bioactive molecule causes cell dath. (II) Is useful as hybridisation probes, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, and for the genetic analysis of individuals with genetic disorders, in gene therapy, and for chromosome identification. (I) or Ab is useful for the preparation of medicament for creating conditions which are responsive to the PRO polypeptide or antificating conditions which are responsive to the PRO polypeptide or antificating tumnour growth, enhances vascular permeability and immune inhibiting tumnour growth, enhances vascular permeability and immune response, for inhibiting regeneration of auditory hair cells and for

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

# Example 17; Page 60; 255pp; English.

The invention relates to an isolated, secreted/transmembrane polypeptide, termed PRO polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 37 sequences appearing as ABU79779 equence selected from any one of the 37 sequence and people and an uncleic acid molecule deposited under any one of the ATCC numbers given in the specification. Also included are an isolated nucleic acid molecule having at least 80% sequence identity to a sequence selected from any one of the 37 CODNA sequences defined in the specification (or encoding the mature PRO protein or a PRO protein extracellular domain), a PRO expression vector, protein or a PRO protein extracellular domain), a PRO expression vector, a hoist cell comprising the vector, PRO fusion proteins, anti-PRO antibodies and a method for linking a bioactive molecule is a toxin, expressing the above PRO polypeptides, the bioactive molecule is a toxin, adiolabel or an antibody and causes the death of the cell. PRO or the antibody is useful for modulating at least one biological activity of cell expressing the above polypeptides. PRO is useful for identifying aponists or antagonists of PRO, for preparing a variant of PRO, as molecular weight markers for protein electrophoresis purpose and PRO uncleic acid is useful for recombinantly expressing those markers. PRO is also useful as therapeutic agent. PRO is useful in assays to identify

```
cuther proteins or molecules involved in binding interaction. PRO nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, in gene therapy, for generating transgenic animals or knockout animals which in turn are useful in the development and soreening of therapeutically useful reagents, to construct hybridisation probes for mapping the gene which encodes the PRO and for the genetic analysis of individuals with genetic disorders, for chromosome of individuals with genetic disorders, for chromosome polymerase chain reaction (PCR), Northern analysis, Southern analysis and Western analysis. The antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, for affinity purification of PRO from recombinant cell culture or natural sources. PRO or Ab is useful for the preparation of medicament for treating conditions which is responsive to the PRO polypeptide or antibres present sequence is a probe used to isolate cDNA encoding a PRO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                        02-JUN-1
15-JUN-1
  The invention relates to an isolated secreted/transmembrane PRO polypeptide. The polypeptide and its nucleic acid is useful as an inhibitor of vascular andothelial growth factors stimulated proliferation of endothelial cells, as a stimulator of T-lymphocyte proliferation, as an inducer of endothelial cell apoptosis, c-fos and differentiation of pancreatic beta cell precursors into mature cell, for induction of redifferentiation and/or proliferation of chondrocytes and for modulating glucose or free fatty acid (FFA) uptake by skeletal muscle cells. The colypeptide and its nucleic acid is useful for generating transgenic or knock-out animals, for tissue typing and for chromosome identification. The polypeptide is useful in a number of functional biological assays, and conformal weight marker for protein electrophoresis, and as therapeutic agents. The nucleic acid is useful as hybridisation probe, in the generation of antisense RNA and on gene therapy. The nucleic acid is also useful as hybridisation probe for a cDNA library to isolate the full length PRO cDNA, to isolate other cDNA and in gene therapy. The nucleic acid is also useful as hybridisation probe for a cDNA library to isolate the full length processed useful in the construction of hybridisation probes for mapping the gene encoding PRO, and for the genetic analysis of individuals with the genetic disorders. The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; PCR; PRO; secreted and transmembrane protein; gene therapy; abneraccolitis; gastrointestinal ulceration; skin disease; asthma; primer; abnormal keratinocyte differentiation; psoriasis; epithelial cancer; squamous cell carcinoma; Alzabaner's disease; Parkinson's disease; amyotrophic lateral sclerosis; inflammatory disease; organ failure; rheumatorid arthritis; multiple sclerosis; atherosclerosis; infertility; cardiac injury; birth defect; premature aging; AlDS; cancer; diabetic complication; wound repair.

treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's disease.
                  Example 17; Page 60; 154pp; English.
```

The invention relates to an isolated native sequence PRO polypeptide (secreted and transmembrane protein) having 80% sequence similarity to one of 37 proteins sequences (or PRO lacking its signal peptide, a PRO one of 37 proteins sequences (or PRO lacking its signal peptide) a PRO one of 37 proteins sequences (or PRO lacking its signal peptide) by a nucleic acids, 80% identical to one of 37 prox sequences, shown in the specification. Also included are vectors comprising the PRO nucleic acids, host cells comprising the vectors (used to produce the PRO proteins), a chimacaric molecule comprising the PRO polypeptide fused to a pretaction and acid sequence, an anti-PRO antibody, linking a bloactive molecule to a cell expressing the PRO polypeptides and molecule acids are useful in diagnosing or treating enterocolitis, gastrointestinal ulceration, skin diagnosing or treating enterocolitis, gastrointestinal ulcration, e.g. polypeptides and acids are useful in diagnosing or treating enterocolitis, gastrointestinal ulcration, e.g. dispense, parkinson's disease, amyotrophic lateral sciences; confilammatory diseases, Parkinson's disease, anyotrophic lateral sciences; confilammatory diseases, parkinson's disease, anyotrophic lateral sciences; confilammatory diseases, garkinatorial acidic acids are also useful in preparing PRO polypeptides, in assays to mucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating entiesses which in turn are useful in the development and screening of therapetically, which in turn are useful in the development and screening of therapetically, which in turn are useful in the development and screening of therapetically, and as molecular weight markers for protein and in diagnostic assays for PRO, or for the affinity or purification, and disgnostic assays for PRO, or note the affinity or purification of PRO from recombinant cell culture or neurons. The artibodies may be used in diagnostic assays for PRO, or note the affinity or purification of PRO Fr ö present sequence is a PCR primer used to isolate a cDNA encoding a PRO protein of the invention . 49.7%; Score 16.4; DB 9; Length 43; 76.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated secreted/transmembrane PRO
polypeptide. The polypeptide and its nucleic acid is useful as an
inhibitor of vascular endothelial growth factors stimulated proliferation
of endothelial cells, as a stimulator of T-lymphocyte proliferation, as
an inducer of endothelial cell apoptosis, c-fos and differentiation of
pancreatic beta cell precursors into mature cell, for induction of
redifferentiation and/or proliferation of chondrocytes and for modulating
collypeptide and its nucleic acid is useful for generating transgenic or
knock-out animals, for tissue typing and for chromosome identification.
The polypeptide is useful in a number of functional biological assays, as
molecular weight marker for protein electrophoresis, and as therapeutic
gents. The nucleic acid is useful as a hybridisation probe, in
chromosome and gene mapping, in the generation of antisense RNA and DNA,
and for the preparation PRO polypeptides. The nucleic acid is also useful
as hybridisation probe for a cDNA indensity. The nucleic acid is also
cond, to isolate other cDNA and in gene therapy. The nucleic acid is also
conding PRO, and for the genetic analysis of mapping the gene
cenceding PRO, and for the genetic analysis of individuals with the
genetic disorders. The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The invention relates to an isolated secreted/transmembrane PRO polypeptide. The polypeptide and its nucleic acid is useful as an animhibitor of vascular endothelial growth factor stimulated proliferation of endothelial cells, as a stimulator of T-lymphocyte proliferation, as an inducer of endothelial cell apoptosis, c-fos and differentiation of parcreatic beta cell precursors into mature cell, for induction of redifferentiation and/or proliferation of chondrocytes and for modulating glucose or free fatty acid (FPR) uptake by skeletal muscle cells. The polypeptide and its nucleic acid is useful for generating transgenic or knock-out animals, for tissue typing and for chromosome identification. The polypeptide is useful in a number of functional biological assays, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 17; SEQ ID NO 61; 259pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ovarian tumors.
The invention describes an isolated polypeptide (I) having at least 80 % amino acid sequence identity to 30 secreted and transmembrane polypeptides. PRO polypeptides are also useful for stimulating configuration of adult heart, for inhibiting vascular endothelial growth factor stimulated proliferation of endothelial cells, stimulating proliferation of stimulated T-lymphocytes and for inducing proliferation of proliferation of stimulated T-lymphocytes and for inducing proliferation of stimulated T-lymphocytes and for inducing proliferation of proliferation of endothelial nether treatment of disorders which involve protein secretion by the pancreas, including diabetes. PRO polypeptides are useful for inducing vascular permeability and in enhancing survival of retinal neurons cells and are thus useful for the treatment of retinal disorders. PRO polypeptides are also useful for stimulating an immune response and inducing inflammation by inducing mononuclear cell and eosinophil infiltration at the site of infection of an animal. The PRO polypeptides are further useful for inducing apoptosis in endothelial cells for inhibiting neoplastic growth. This sequence represents a probe used to detect DNA encoding a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
The invention relates to an isolated secreted/transmembrane PRO polypeptide. The polypeptide and its mucleic acid is useful as an inhibitor of vascular endothelial growth factor stimulated proliferation of endothelial cells, as a stimulator of T-lymphocyte proliferation, as an inducer of endothelial cell apoptosis, c-fos and differentiation of pancreatic beta cell precursors into mature cell, for induction of redifferentiation and/or proliferation of chondrocytes and for modulating glucose or free fatty acid (FFA) uptake by skeletal muscle cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Seventy four nucleic acids encoding PRO polypeptides, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 17; SEQ ID NO 61; 261pp; English.

        ô
molecular weight marker for protein electrophoresis, and as therapeutic agents. The nucleic acid is useful as a hybridisation probe, in chromosome and gene mapping, in the generation of antisense RNA and DNA, and for the preparation PRO polypeptides. The nucleic acid is also useful as hybridisation probe for a cDNA library to isolate the full length PRO cDNA, to isolate other cDNA and in gene therapy. The nucleic acid is also useful in the construction of hybridisation probes for mapping the gene encoding PRO, and for the genetic analysis of individuals with the genetic disorders. The present sequence represents a human secreted/transmembrane PRO polypeptide probe.
                                                                                                                                                                                                  ,Gaps

```
polypeptide and its nucleic acid is useful for generating transgenic or knock-out animals, for tissue typing and for chromosome identification. The polypeptide is useful in a number of functional biological assays, as molecular wight marker for protein electrophoresis, and as therapeutic agents. The nucleic acid is useful as a hybridisation probe, in chromosome and gene mapping, in the generation of antisense RNA and DNA, and for the preparation RNO polypeptides. The nucleic acid is also useful as hybridisation probe for a CDNA library to isolate the full length PRO CDNA, to isolate other cDNA and in gene therapy. The nucleic acid is also useful in the construction of hybridisation probes for mapping the gene encoding PRO, and for the genetic analysis of individuals with the genetic disorders. The present sequence represents a human secreted/transmembrane PRO polypeptide probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 43 BP; 9 A; 14 C; 9 G; 11 T; 0 U; 0 Other;

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 65283; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,

The invention relates to a recombinant adenovirus comprising a functional pIX coding sequence under the control of an expression sequence comprising part of an EIB 55x sequence capable of increasing expression of the pIX coding sequence in a given packaging cell, relative to the expression of the pIX coding sequence behind its endogenous proximal pIX pubstream sequence without the part of the EIB 55x sequence, with the proviso that the part of an EIB 55x sequence does not code for a functional EIB 55x gene product. Also included are an isolated nucleic acid that upon introduction into a suitable packaging cell constitutes the genome of the above recombinant adenovirus, a method for increasing the stability and/or the packaging capacity of a recombinant adenovirus

New recombinant adenovirus comprising a functional pIX coding sequence, useful for preparing a medicament for the treatment and prevention of diseases or disorders (e.g. cancer or viral infection) in humans or

                      nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly

having at least a deletion in the E1-region (comprising expressing the elements necessary for production and assembly of the recombinant adenovirus into virus particles in a packaging cell in the presence of an elevated level of pIX gene product in the packaging cell, relative to the level of pIX gene product obtained when the pIX cooling sequence is behind its endogenous proximal upstream sequence without E1B 55K sequences), a vaccine comprising the recombinant adenovirus (and, optionally, a suitable carrier or an adjuvant) and a recombinant adenovirus packaging cell comprising the above recombinant adenovirus. The composition and methods are useful for preventing or treating diseases or disorders (e.g. cancer or viral infection) in humans or animal subjects via gene therapy. The methods may also be used in increasing the stability and/or the packaging capacity of the recombinant adenovirus. The present sequence is a PCR primer used in the construction of the recombinant adenovirus

This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where cone strand is an antisense strand (ASS) that is complementary to (part of an HCV RNA (portion) and a sense strand (SS) that is complementary to (part of ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiniflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure, hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The sinA can be directed to conserved regions of HCV genes, so are active against many different strains. NOTE: This sequence may contain one or more of several CC modifications, including 2'-deoxy-2'-fluoro U or C (u or c); thymidine (T); inverted deoxy abasic (B); phosphorothioate linkage (B); universal cancer and itable 3 of the specification (pages 150-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; virus replication inhibition;

New double-stranded short interfering nucleic acid comprises sugarmodified pyrimidine bases useful for treating infection with hepatitis C
                                                                                                            virus.
```

Example 3; SEQ ID NO 1594; 183pp; English.

This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibites replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and sense strand (SS) that is complementary to (ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target dentification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siMA can be directed to conserved regions of HCV genes, so are active against many different strains. NOTE: This sequence may contain one or more of several modifications, including 2'-deoxy-2'-fluoro U or C (u or c); thymidine (T); inverted deoxy absic (B); phosphorothicate linkage (s); universal base 5-nitroindole (Z). These modifications are specified in table 3 of the specification (pages 150-

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its correct match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotlot probes is useful in in situ hybridisation, in Southern, Northern or dotprimer extensions or in screening cDNA or genomic libraries or subclones for additional subclones contabining segments of EDNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence or generally form the patent can also be obtained in electronic format directly form the microarray had an analysis or the sequence.
New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 15.4; DB 9; Length 25; Pred. encoding the humanised antibody Hz484k-1 kappa light chain variable region (VL). The humanised antibody is specific to human 4-1BB receptor protein and comprises of the complementarity determining region (CDR) of mouse monoclonal antibody (MAD) 4B4-1-1, grafted on to a human antibody. In order to increase the antigen binding affinity of this humanised antibody, about 10 critical amino acid substitutions are made in the framework region (RR) of humanised VL, to resemble the mouse antibody. It functions to block human 4-1BB protein receptor. The humanised antibody can be used to treat autoimmune diseases, especially rheumatoid arthritis and for immune suppression in transplant rejection. It acts as an effective immunesuppressant, by inhibiting T cell activation, without any

ö
vectors contain recombination sites having a core sequence having at least one engineered mutation that enhances recombination in vitro in the formation of a Cointegrate or Product DNA. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or RNA

The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (RAMMS) comprising; (a) combining in vitro or in vivo; (1) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 recombination or sites which do not recombine with each other; (2) one or more vector donor molecules (VDMS) comprising at least 2 recombination aites which do not recombine with each other; and (3) one or more vector recombine with each other; and (3) one or more site-specific recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the WDMS, thereby concluding one or more desired product molecules (PMS). The methods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that have the also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention

The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AAC87881) acquences complementary to AAC87881, or an RNA sequence corresponding to AAC8766 to AAC87881. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first cutated recombination site that removes one or more stop codons from the recombination site or avoids hairpin formation, the recombination site or avoids hairpin formation, the recombination site comprising a mutation that chances recombination specificity, (3) vectors (IV) comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in engineering a core region of a given recombination site to profice mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining core maineered recombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and less labour intensive. The present sequence represents a PCR primer for chloramphenicol acetyl transferase (CAT), which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered
                                                                                                                                                                                                                                                                                                                                                             Core region; recombination site; cloning; chimeric DNA; PCR primer; characteristic; mutation; att site; lox site; chloramphenicol acetyl transferase; CAT; ss.

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors ach comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the mucleic acid of interest; contacting hosts with the mixture; and selecting against a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector, to clone the nucleic acid. The present sequence is a PCR primer for chloramphenicol acetyl transferase (CAT), which was used to exemplify the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host.
                                                                                                                                                                                                                                   Recombination site; cloning; CAT; chloramphenicol acetyl transferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Methods for apposing nucleic acids comprising an expression signal and a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression algnal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene with methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for theirs on proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxP site at the other end), genomic DNAs, and cDNAs. The methods are also yequic in the present sequence is a PCR primer used for amplifying Chloramphenicol acety] transferase (CAT) gene used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CAT; 5' uracil extension; vector donor DNA; flanking recombination site; ss; chloramphenicol acetyl transferase; PCR; primer.

```
The invention relates to a vector donor DNA molecule comprising a first DNA segment and a second bnA segment containing at least one selectable marker. The first and second segments are separated either by, in a circular vector donor, a first and a second recombination site, or in a linear vector donor, at least a first recombination site, where each pair of flanking recombination sites are engineered and do not recombine with each other. The nucleic acid molecule, vectors and methods are useful for moving or exchanging segments of DNA molecules using engineered recombination sites and recombination proteins to provide chimeric DNA molecules that have the desired characteristic(s) and/or DNA segment(s). The present sequence represents the chloramphenicol acetyl transferase, CAT 5' uracil extension primer CAT right
                                                                                                                                                                                                                                                                                                                   New Vector Donor DNA molecule for recombinational cloning using engineered recombination sites, comprises first and second DNA segments that do not recombine with each other and that contain a Selectable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CAT; 5'.uracil extension; cointegrate DNA; flanking recombination site; ss; chloramphenicol acetyl transferase; PCR; primer.

This invention relates to novel DNA and vectors having engineered recombination sites for use in a cloning method that enables efficient and specific recombination of DNA segments using recombination proteins including recombination of DNA segments using recombination proteins including recombination of the such provides a method for obtaining characteristics, facilitating DNA cor RNA subcloning, regulation and/ or exchange. The recombination site is derived from attB attP, attL or attR, where the att site is attl, att2 or att3. Engineered mutations of the att sites (either one or multiple catting in and the properties of the product DNA molecules. Accordingly, the present invention describes a nucleic acid molecules comprising at least one DNA segment having at least two engineered recombination sites flanking a selectable marker and/ or a desired DNA segment. Purthermore, at least one of the engineered sites must enhance recombination in vitro form a cointegrate or product DNA molecule. This oligonucleotide sequence is the PCR primer CAT right used to amplify the chloramphenic catelors base 5' extension of uracil bases in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinational cloning; DNA exchange; core region; CAT; PCR; primer; chloramphenicol acetyl transferase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chloramphenicol acetyl transferase gene amplifying primer, CAT right.
                                                                                                                                    New Vector Donor DNA molecule, useful for recombinational cloning purposes, comprises a first and a second DNA segment that contains a selectable marker and is separated by a pair of flanking, engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     46.7%; Score 15.4; DB 9; Length 33; 76.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of making a cointegrate DNA molecule. The method is useful for making a cointegrate DNA molecule. The method is useful for a variety of DNA exchanges, such as subcloning of DNA, in vitro or in vivo. The method enables efficient and specific recombination of DNA segments using recombination proteins. The method is highly specific, rapid and less labour intensive. The improved specificity, yield and speed of the method facilitates DNA or RNA subcloning, regulation and exchange useful for other related purposes. Since single molecules of the recombinations product can be introduced into a molecules of the readily realised. Reaction conditions can be treely adjusted in vitro to optimise enzyme activities. The present sequence represents the chloramphenical acetyl transferase, CAT 5' uracil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   engineered recombination site; cloning; recombinase; subcloning; attB; attE; attR; selectable marker; cointegrate; ss; primer; PCR; DNA/RNA hybrid; CAT right; chloramphenicol acetyl transferase; pACYC184.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primer CAT right containing a 12-base 5' extension of uracil bases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                             Making Cointegrate DNA molecule, by combining recombination sites flanking the desired DNA segment in insert donor DNA, with the recombination sites of vector donor DNA, using site specific recombination protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The invention relates to a vector donor DNA molecule which comprises first and second DNA segments that do not recombine with each other and that contain a selectable marker. The invention also relates to a method for recombinational cloning using engineered recombinations sites. The invention is useful for moving or exchanging segments of DNA molecules using engineered recombination sites and recombination proteins to provide chimeric DNA molecules that have the desired characteristic(s) and/or DNA segment(s). The present sequence is a PCR primer used for amplifying chloramphenicol acetyl transferase (CAT) gene. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          recombination protein; recombination site; Insert Donor DNA;

The invention describes a composition comprising recombination proteins and an isolated nucleic acid molecule comprising a recombination site.

The composition comprises one or more isolated recombination proteins and at least one Insert Donor DNA molecule comprises: at least a first recombination site, containing at least one mutation, where the mutation removes one or more stop codons from the recombination site and a second recombination site, where the first and second recombination site, where the first and second recombination site and a second recombination site, where the first and a second recombination site, where the first and a second recombination site on the repression cassette encoding a repressor and a Selectable marker that is repressed by the repressor where the sequence selected from each other by at least one recombination site; at least cone nucleic acid sequence that is 80-99% homologous to one or more of a nucleic acid sequence comprising 25 bp (SEQ ID NO. 1-16). Also described are: a kirk for in vitro cloning; a method for comprising one or more isolated recombination proteins and at least one nucleic acid above. The compositions, methods and a reaction mixture made by the method cabove. The compositions, methods for in vitro cloning; a method for recombination are useful for recombination are useful for recombination sites and recombination proteins and sequence of a primary of proteins and recombination sequence of primary of proteins and recombination of a vector for sequence represents a primar used to isolate the account of a vector for recombination of a vector for a certin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                      The present invention describes a chimeric virus comprising influenza virus containing a heterologous RNA segment from another strain of influenza virus or 8 genomic segments from different strains of influenza virus, with each segment comprising the reverse complement of a mRNA coding sequence operatively linked to a binding site specific for an RNA-directed RNA polymerase of a negative strain RNA virus. The recombinant negative strain virus RNA templates may be used to express heterologous gene products in appropriate host cell systems and/or to construct recombinant viruses that express, package and/or present the heterologous gene product. The expression products and chimeric viruses may be used in vaccine formulations. ANY57746 to AAY57748, and AAZ56234 to AAZ56290,

                                                                                                                                                        The present invention describes a chimeric virus comprising influenza virus containing a heterologous RNA segment from another strain of influenza virus or 8 genomic segments from different strains of influenza virus, with each segment comprising the reverse complement of a mRNA coding sequence operatively linked to a binding site specific for an RNA-negative strand RNA virus. The recombinant negative strand virus RNA templates may be used to express heterologous gene products in appropriate host cell systems and/or to construct ecombinant viruses that express, package and/or present the heterologous gene product. The expression products and chimeric viruses may be used in vaccine formulations. ANY57746 to AAY57748, and AAZ56234 to AAZ56290,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequence and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4 hydroxylase (cytochrome p450 2D6; CYP2D6) -related target oligonucleotide of the
gene product. The expression products and chimeric viruses may be used in vaccine formulations. AAY57746 to AAY57748, and AAZ56234 to AAZ56290, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.

New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotide detection assay; debrisoquine 4-hydroxylase; CYP2D6;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 15.2; DB 12; Length 41;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequences and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonuclectide detection assay; debrisoquine 4-hydroxylase; CYP2D6; cytochrome p450; human; 88.

                                                            the
                                                                                                                                                 The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CPP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              t 4-

Also disclosed is a method of applying the polypeptide in treating various diseases, such a discorder, hemeopathy and HIV infection. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The present invention also discloses the application of the polypeptide and its treatment effect. The present invention also discloses the application of the lower concoding nuclear factor Kappa-B DNA binding subunit the nuclear factor kappa-B DNA binding subunit the nuclear factor kappa-B DNA binding sub-unit 10.23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nuclear factor Kappa-B DNA binding subunit 10.23; malignant tumour; inflammation; immunological disease; development disorder; haemopathy; human immunodeficiency virus; HIV infection; PCR; primer; ss.

The invention comprises a method for producing a polyhydroxyalkanoate (PHA) -containing structure. The method involves immobilising a PHA synthase enzyme on a base material surface and then synthesising PHA using 3-hydroxyacyl coenzyme A as a substrate. The method of the invention is useful for manufacturing a PHA-containing structure. The PHA containing structures, such as a wide range of applications as a variety of functional structures, such as: a pigment dispersant of excellent dispersion stability; a toner for electrophotography of excellent electrospeatic property; and the laminated structure as an OHP film. The structure is also useful for microcapsule pigment ink of excellent dispersion stability, an electrophoresis particle for electrophoresis display, and colouring composition for a colour filter. The present DNA sequence represents a PCR primer that was used in the exemplification of the invention.
                                                                                                                                                                                                  Manufacturing polyhydroxyalkanoate-containing structure useful as toner for electrophotography, by immobilizing polyhydroxyalkanoate synthase on base material and synthesizing polyhydroxyalkanoate on base material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 38 BP; 8 A; 10 C; 12 G; 8 T; 0 U; 0 Other;
